

VALIDATING AI ARCHITECTURE AGAINST LEGAL BASELINES

Technical designs fail if they ignore the legal layer. This module translates US and EU legal frameworks into architectural constraints so you can spot structural flaws before you build.

LEGAL BASELINE	ARCHITECTURAL CONSTRAINT	STATUS CHECK
US: FTC ACT (UNFAIR/DECEPTIVE)	FAIRNESS METRICS & AUDITABILITY	[FAIL - BIAS DETECTED]
EU: GDPR (DATA PRIVACY)	DATA MINIMIZATION & CONSENT MANAGEMENT	[WARN - EXCESSIVE RETENTION]
EU: AI ACT (HIGH-RISK SYSTEMS)	RISK MANAGEMENT & CONFORMITY ASSESSMENT	[CRITICAL FAIL - NON-COMPLIANT SYSTEM DESIGN]

LEGAL BASELINE	ARCHITECTURAL CONSTRAINT	STATUS CHECK
US: FTC ACT (UNFAIR/DECEPTIVE)	FAIRNESS METRICS & AUDITABILITY	[FAIL - BIAS DETECTED] ❌
EU: GDPR (DATA PRIVACY)	DATA MININIZATION & CONSENT MANAGEMENT	[WARN - EXCESSIVE RETENTION] ❌
EU: AI ACT (HIGH-RISK SYSTEMS)	RISK MANAGERENT & CONFORMITY ASSESSMENT	[CRITICAL FAIL - NON-COMPLIANT SYSTEM DESIGN]

PARSING PUBLISHED OPINIONS TO EXTRACT EXECUTABLE RULES

THE DEPENDENCY GRAPH OF LEGAL AUTHORITY

AGENCY GUIDANCE: PERSUASIVE RECOMMENDATION, NOT BINDING RULE

Agency guidance operates as a persuasive recommendation, not a binding rule.

Post-Loper Bright, courts do not automatically defer to agency interpretations. System architects must distinguish between a strict statutory requirement and an agency's non-binding guidance.

DESIGNING FOR A DECENTRALIZED US FEDERAL AI POSTURE

Constraint: The regulatory state for US AI is currently a patchwork of specific agency directives.

Architectural Impact: Do not wait for a unified federal AI code. Build modular compliance checkpoints that can adapt to localized agency rules.

THE EU AI ACT MAPS COMPLIANCE DIRECTLY TO RISK TIERS

Under the EU framework, the systemic impact of your tool dictates your engineering load.

A standard, automated resume-screening bot is instantly classified as an Annex III High-Risk system, triggering massive auditing and implementation timeline requirements.

SYSTEMIC ROLES DICTATE LEGAL OBLIGATIONS: PROVIDER VS. DEPLOYER

THE PROVIDER

Definition: Builds the model and dictates the core system architecture.

Liability: Holds primary compliance burden for model training, bias testing, and foundational safety.

THE DEPLOYER

Definition: Implements the provider's system into a real-world, enterprise environment.

Liability: Responsible for operational oversight, human-in-the-loop controls, and contextual implementation timelines.

**IN A STANDARD ENTERPRISE API INTEGRATION, YOUR VENDOR
IS THE PROVIDER, BUT YOU ARE THE DEPLOYER.**

INTELLECTUAL PROPERTY AT RUNG 100: THE MODULAR IP MAP

Legal risk is modular. Protect and verify each component of your pipeline according to its specific legal regime.

PRE-DESIGN REVIEW VALIDATION CHECKS

SYSTEM LOG / PRE-FLIGHT TECHNICAL SPECIFICATION

- > Verify data provenance for all RAG pipeline inputs (Copyright Check).
- > Identify your EU AI Act systemic role (Provider vs. Deployer) before finalizing vendor APIs.
- > Confirm whether agency rules dictating your architecture are binding statutes or merely persuasive guidance (Loper Bright Check).
- > Access the local study console and source library for deep dives on Week 1 foundations.■
