

Reverse Engineering the AI Contract Stack

System Output: Execution Parameters

```
> run context_check.sh
[OK] Objective: Analyze contract structures, clause maps, provider
terms, DPAs, and AUPs.

[WARNING] Output is educational only.
[WARNING] Output is not legal advice.
[INFO] Data sources restricted to public exemplars.
[INFO] Target Audience: Enterprise Architects.

> end
```

Verify Sales Promises in the Code

The Input

**100%

CAP > 1.2x FEES

EXCLUSION:
THIRD-PARTY
COMPONENTS

DATA SHARING
CLAUSE:
DIAGNOSTICS

LIMITATION OF
LIABILITY:

VOIDANCE
CONDITIONS:
CUSTOM MODS

JURISDICTION:
DELAWARE

When the vendor promises copyright protection or secure boundaries, read the contract stack. The contract is the compiled code of your partnership.

The Foundational Component Map

Execution Logic and Order of Precedence

Check the precedence clause before trusting a sales slide. Top layers structurally nullify conflicting clauses in the layers below.

The Vendor IP Indemnity Firewall

Indemnity acts as a firewall against third-party copyright claims.
But like any firewall, it has specific bypass conditions.

Voider 1: Disabling Safety Filters

[Safety Filters = OFF]

[Firewall Status = SHUTDOWN]

Bypassing or disabling the vendor's built-in safety filters instantly voids the IP indemnity coverage.

Voider 2: Intentional Infringement

Prompts designed to intentionally seek out and generate infringing material trigger an automatic bypass of the indemnity shield.

Voider 3: Customer Fine-Tuning and RAG Data

The vendor firewall does not extend to the proprietary data you bring into the system via fine-tuning or Retrieval-Augmented Generation.

Anthropic Pipeline: Validating Zero-Retention

Enterprise terms promise zero-data-retention. Confirm this applies precisely to your specific tier and deployment.

Anthropic Pipeline: Customer Data versus System Logs

Know the exact contractual boundary distinguishing your ephemeral prompts from retained system diagnostic logs.

OpenAI Addendum: The No-Training Pledge

COMPANY BLOG POST WIREFRAME

[NON-BINDING]

LEGAL DOCUMENT WIREFRAME

[BINDING CONTRACT FACT]

A 'no-training' pledge must exist as an explicit, verifiable fact inside the contract stack, not just as a promise on a public blog.

OpenAI Addendum: Abuse Monitoring Data Flows

Data retained for abuse monitoring follows an isolated pipeline.
It is structurally walled off from model training pipelines.

The Dangerous Abstraction of “The Cloud”

Anti-Pattern:
The Cloud Covers You

Do not merge different providers into one generalized assumption.
Major hyperscalers deploy fundamentally different legal architectures.

Hyperscaler Topologies: Indemnity Shapes

AWS Bedrock	Azure OpenAI	GCP Vertex
		
Filter Requirements ✓	Filter Requirements ✓	Filter Requirements ✓
Custom Data Protection ✗	Custom Data Protection ✗	Custom Data Protection ✗
Intentional Exclusions ✓	Intentional Exclusions ✓	Intentional Exclusions ✓

AWS, Azure, and GCP trigger and limit their respective indemnities using entirely different frameworks.

Locating the Critical Dependency

The Acceptable Use Policy is the lowest layer of the stack, but it carries the highest operational risk for for the enterprise.

The Operational Kill Switch

An AUP breach is not merely a legal liability risk; it acts as a physical kill switch, resulting in immediate API service cutoff.

The Annotated Clause Map

AUP Breach = Physical Cutoff
